How to customize action on right click

Navigate-Pro permits partners to add some behaviors on the package, like printing, connecting to external source etc. In fact, the App exposes an event on right click, sharing a record id of the selected document.

Partners can develop their App, using Navigate-pro as dependency, implementing a routine, consuming the right click event of the page.

Example of consuming the right click event:

```
[EventSubscriber(ObjectType::Page, Page::IST_NavigatePro, 'OnRightClickEvent', '',
false, false)]
    local procedure fExposeRightClickEvent(myRecordID: RecordId)
    begin
        fHandleRightClickEvent(myRecordID);
    end;
```

In the *fHandleRightClickEvent* function, it is possible to add a strmenu with multiple options, to manage different choices:

```
local procedure fHandleRightClickEvent(MyRecordId: RecordId)
    var
        lSelection: Integer;
        SalesInvHeader: Record "Sales Invoice Header";
        TextDialog: Label 'Print Document,Mail Document,Open Attachments,...';
    begin
        lSelection := Dialog.StrMenu(TextDialog,1);

        case lSelection of
            1: Message('Rigt Click Behaviour Is Customizable by partners');
            2: Message('Clicked Table %1'   , MyRecordId.TableNo);
            3: Message('Clicked RecordId %1', MyRecordId);
            4:
                begin
                    //Retrieve a record by RecordId
                    if MyRecordId.TableNo =112 then
                        SalesInvHeader.get(MyRecordId);

                end;
        end;
    end;
```

Where the strmenu text could be, for example (just to give an idea of what you can do, attached to a right click event) :

```
TextDialog: Label 'Print Document,Mail Document,Open Attachments,...';
```
