# Installation

To install Navigate Pro on a BC Environment on premises you will need:

1. Last Navigate Pro App file.
2. DeployNavigateProBC.ps1 script (You can skip using this script writing your own PowerShell commands).

To install Navigate Pro (if you don't want to upload directly from the extension management page):

1. Remove (uninstall and unpublish) previous version of Navigate pro app.

2. Copy the ".app" file on a directory with full access.

3. Run Windows PowerShell ISE as Administrator.

4. Open DeployNavigateProBC.ps1 script file from the BC subfolder, check all the paths, modifying them where needed. Follow the instructions in the script file.

5. Save the script and press F5 to run it. You should find the extension under the extension management page.

6. Now the package Navigate Pro is ready to use.
